

BeerProtect

Special product to protect against oxidation and for the preservation of the aroma potential

Product description

BeerProtect is a special product consisting of potassium disulphite and vitamin C (L(+)-ascorbic acid). It provides for comprehensive protection against oxidation and protects the aroma potential of the beer during filling and storage. BeerProtect is rapidly soluble.

BeerProtect effectively protects from oxidation and stabilises aroma and taste components during the entire manufacturing process of the beer. The antioxidizing effect is high due to its carefully selected constituents and thus the beer aroma is well protected against the influence of oxygen.

Our recommendation: Please do preliminary tests on laboratory scale, to see the influence (quality) on the final beer. Higher dosages can influence the quality of the product and also the total amount of SO₂ content in the product (SO₂ contents > 10 mg/L must be labeled).

National regulations have to be checked by the user.

Dosage

Guided values:

Beer: 1 - 2 g/100 L prior to filtration.

Sulphite activity depends on the pH-value and on the temperature of the beer.

BeerProtect is directly added to the fresh beer. To obtain optimal effectiveness, BeerProtect is dissolved in a small amount of beer, then added, or, it is directly added into the kieselguhr container.

Storage

Store cool, dry, protected from odours and light. Reseal opened packagings immediately and tightly. Keep out of reach of children.
